Subject: the Leviathan Mine Superfund Site Update

Dear Colleagues,

I'm writing to provide an update on winter operations at the Leviathan Mine Superfund Site. The early spring treatment area continues to keep up with the flows, however there is now one other area of possible concern, and a separate discharge has occurred relative to broken equipment. Please find an update on all activities below:

1) On March 3rd, early spring treatment began in Pond 1, 2 North and 2 South (Upper Ponds) in order to treat and discharge water accumulated in the three on-site holding ponds (a total of 13 million gallons of capacity) using a Rotating Cylinder Lime Treatment System. Despite the

Water Board treating more than 5 million gallons of water to date, less than 1 inch of freeboard remains in Pond 1 and less than 4 inches of freeboard still remain in Ponds 2 North and 2 South. Any overflow from the Upper Ponds would pass through Pond 3 and be partially treated before discharge to Leviathan Creek. In the event of an overflow, samples would be taken and analyzed. To date, laboratory analysis of the treated water discharges shows that all discharge criteria were met except for one release that had a minor exceedance of copper values. EPA is receiving weekly reports and daily updates from the Water Board and will be notified of any changes. As the case was when we first reached out to you, we will provide notification in the event of an overflow.

2) On April 5th EPA received notification of an issue at the Aspen Seep Bioreactor (ASBR). Atlantic Richfield's (ARC's) remote monitoring at the ASBR showed a slight increase in the water elevation in the 4th pond, indicating that the Aspen Seep influent flow rate was outpacing the treated effluent flow rate. ARC accessed the site on April 6th and the Aspen Seep 4th Pond outlet was cleared of debris, the 1-inch diameter outlet pipe was replaced with a 2-inch diameter pipe, and the pond water level was lowered by pumping treated water to the discharge aeration channel. EPA has requested that ARC take samples of the ASBR discharge in order to assess if the ASBR is fully functioning at the high flow rates and continues to meet the discharge criteria. Since this 4th pond is a settling pond to remove solids from the ASBR treated water, EPA does not anticipate significant impacts to the water quality. While a discharge of untreated Aspen Seep acid mine drainage has not occurred to date, EPA is communicating with ARC and monitoring the situation. EPA has asked ARC to provide a full assessment of long term impacts of the increased influent flows on the functionality of the bioreactor, and the ability of the ASBR to successfully treat increased flows anticipated to occur through this Spring and meet all discharge criteria.

3) On April 6th EPA received notification of an issue at Pond 4 near the High Density Sludge Treatment system (HDS Plant). At Pond 4, the overflow standpipe is broken and a discharge is currently taking place through the Pond 4 overflow standpipe (near the HDS plant) to Leviathan Creek. Approximately 40-50 gpm is flowing through the 4-inch PVC Pond 4 overflow pipe (Pond 4 near the HDS plant) into Leviathan creek. Today, April 7, 2017, Atlantic Richfield has accessed the site and contractors are repairing the broken overflow pipe. However, a significant winter storm is forecast at the Site and ARC cannot ensure that work crews will be able to complete the repair. ARC will provide an update this evening with more details including an estimate of the quantity of water discharged and flow rates. EPA has requested that ARC also collect samples for laboratory analysis to provide a direct measurement of metal contents in the pond water being discharged. The water in Pond 4 consists mostly of melted snow and is believed to be dilute, though likely acidic.

EPA maintains data sondes at the confluence of 4L Creek with Leviathan Creek and at Station

15 in Leviathan Creek. Sonde measurements occur every 15 minutes and are accessible online at <https://stormcentral.waterlog.com/SiteDetails.php?a=116&site=351&pa=usepar9>, Both locations are downstream from where the Pond 4 discharge enters Leviathan Creek. . EPA is monitoring the water quality parameters measured by these sondes including pH and specific conductance. The data over the last seven days at both stations do not show impacts of a release from Pond 4. EPA will continue to monitor the situation remotely, ARC is to provide daily updates, and EPA will share data as it becomes available.

If you have any questions, or would like additional details, please feel free to contact me or Lynda Deschambault, who can be reached via phone at (415) 947-4183 or email at Deschambault.lynda@epa.gov.

Sincerely,

Dana Barton
